

EnviCheck water recycling and reuse

We show you how you can recycle and reuse water sustainably.

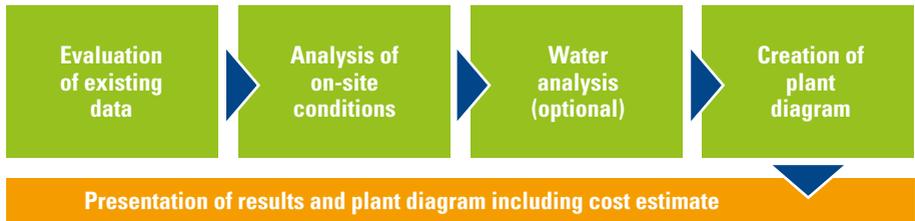

EnviCheck water recycling and reuse

Optimise drinking water consumption and reduce the amount of wastewater created – and in doing so, lower operating costs and secure the supply of your own water.

We identify the treatment processes that are suitable for your water flows, to ensure that used water can be made available again in the required quality.

Our service for you:

Free preliminary consultation and initial evaluation by EnviroChemie

Examples of water recycling in food processing:

- **Partial flow treatment:** rinsing water, cooling water, vapour condensates, permeates
- **Full flow treatment:** preparing treated water again

You define the water quality required, and we ensure its availability – for example, as boiler feed water, cooling tower make-up water, rinsing water or other process water, whether in potable or ultrapure quality.
